

My husband, Eric, and I went to a pet professionals conference in September. The opening speech was about canine diets, how sugar feeds cancer, and how several studies have proven that by feeding veggies and raw meat instead of, or in addition to, kibble can slow, stunt, or REVERSE cancer. SAY WHAT?!? We were all ears. BTW, if you haven't read my previous blog post about the amount of sugar in kibble, even in grain free kibble (you can find the link at the bottom of this post).

This was very near and dear to our hearts as two of our three dogs have been diagnosed with cancer.

Morgyn is a Neapolitan Mastiff who is 8.5 years old and has skin cancer on her cheek. Her tumor was always seeping and bleeding. And our next step was to send her to surgery. The quote was over \$800. According to AKC's website, a Neo's life expectancy is 7-9 years.

Kaster is a Pit Bull mix who is 11 years old and has a large, stage 4 tumor, in his mouth. According to PetMD.com, a Pit Bull's life expectancy is 12-14 years. Before this conference, we had always assumed this was the normal cycle of life: get old, get cancer, and...well, you know the rest.

When we arrived home, we immediately went grocery shopping to buy everything suggested to add to their kibble. See below to what and how much we fed. We started adding all this to their kibble on September 20th.

On Monday, October 9th, (THAT'S ONLY 19 DAYS LATER, Y'ALL) we noticed her skin cancer was GONE. Let me say that again, HER CANCER WAS GONE!!! She has a scar, where it used to be.
